## SUMMARY

This addendum reports the results of an extension to the study carried out at Cernell Aeronautical Laboratory for the U. S. Army (Contract No. DA 30-069-AMC-645(R)) to determine the time varying flow in the vicinity of a helicopter rotor in hovering or forward flight and having a fuselage immersed in the rotor wake. The purpose of this extension was to compare two models representing the fuselage. The first fuselage model, reported in Parts 1 and 2, was based upon the assumption that the fuselage was immersed in a constant and uniform flow; the second model was based upon the assumption that the fuselage was immersed in a constant but non-uniform flow.

Comparisons between the two models are presented.

Also presented is the digital program employed to solve the problem.

## FOREWORD

The work reported herein, performed between January 1966 and April 1966, was accomplished by the Cornell Aeronautical Laboratory, Inc. (CAL), Buffalo, New York, for the Director of Ballistic Research Laboratories, (BRL) Aberdeen Proving Ground, Maryland. The research effort was performed under Contract DA 30-069-AMC-645(R) and was monitored for BRL by Mr. Thomas Coyle as Technical Supervisor. Dr. Peter Crimi and Mr. Andrew R. Trenka of CAL conducted the study. Mr. Harvey Selib developed the digital computer program.

This document is an addendum to Parts 1 and 2 of the final report under the contract. It describes the modifications made to the theory and the digital program to allow the determination of the effects of a fuselage immersed in a constant, nonuniform flow. Part 1 of the final report describes the development of the theory, discusses the results of the computation, and provides a comprehensive discussion of the work performed under the contract. Part 2 of the final report describes the formulation and application of the rotor wake-flow computer program and is of use primarily to those who plan to use the digital computing program.

CAL Report Numbers have been assigned as follows:

BB-1994-S-1, THEORETICAL PREDICTION OF THE FLOW  
IN THE WAKE OF A HELICOPTER ROTOR, Part 1 - Develop-  
ment of Theory and Results of Computations

BB-1994-S-2, THEORETICAL PREDICTION OF THE FLOW

## SYMBOLS

$B_{mn}$	coefficients relating velocities induced by element $n$ and its image on element $m$
$N_A$	number of azimuthal stations per revolution
$N_B$	number of rotor blades
$N_f$	number of fuselage points
$R$	rotor radius
$V_f$	free stream velocity
$V_x^{(m)}$ & $V_z^{(m)}$	$x$ and $z$ components of the time averaged local velocity at $m$
$V_{x\infty}$ & $V_{z\infty}$	time and spacial averaged velocities in the $x$ and $z$ directions
$V_{xf}$ , $V_{yf}$ , $V_{zf}$	$(x, y, z)$ components of velocity induced by the fuselage
$V_{xm}$ , $V_{ym}$ , $V_{zm}$	the $(x, y, z)$ components of velocity induced at a point $m$ by a source of unit strength
$W$	aircraft weight
$x, y, z$	rectilinear coordinates with origin in the tip-path plane, nondimensionalized by $R$
$\alpha_T$	inclination of the tip-path plane to the free stream
$\lambda$	blade loading parameter; $\lambda = 4W / (\pi^2 N_B \rho \Omega^2 R^4)$
$\lambda_{\xi_m}$ & $\nu_{\xi_m}$	direction cosines of the normal to the $m^{th}$ element with respect to the $(x, z)$ axes
$\mu$	advance ratio; $\mu = V_f / \Omega R$
$\rho$	air density
$\sigma_n$	normal component of the normalized source strength per unit area of the $n^{th}$ element
$\sigma_{zn}$	$z$ -component of the normalized source strength per unit area of the $n^{th}$ element

$\sigma_{zn}$        $z$ -component of the normalized source strength per unit  
 area of the  $n^{th}$  element  
  
 $\psi_k$       rotor azimuth angle at  $k^{th}$  position  
  
 $\Omega$       rotor angular speed

## 1. INTRODUCTION

As was described in Part 1 of this report (Reference 1), a model for a helicopter fuselage was developed consisting of an array of quadrilateral source sheets. This model formed part of the representation used for determining the flow in the wake of a helicopter rotor. The strengths of the individual source sheets were assigned by satisfying the fuselage boundary condition resulting from a steady uniform free stream. The magnitude and direction of this free stream were determined by computing an average in space and time of the flow obtained, in the absence of the fuselage representation, in the region the fuselage would normally occupy.

Extensive calculations revealed that the fuselage was adequately represented in this manner for a wide range of flight conditions, provided the region of interest in the flow was sufficiently removed (on the order of one to two-tenths of a rotor radius) from the fuselage. However, considerable spacial variation of the time average of the flow over the region occupied by the fuselage was observed to be present in most cases, so that the flow was not well represented in the immediate vicinity of the fuselage surface.

This addendum reports the results of work performed subsequent to completion of the study reported in References 1 and 2. The objective of this continuation was to develop and evaluate an improved fuselage representation which takes account of the nonuniformity of the time average of the flow imposed on the fuselage. The procedures used in implementing the improved model are described in Section 2. The results of the computations performed are discussed in Section 3. A listing of the modified digital programs is presented in Appendixes I and II. Familiarity with the developments of References 1 and 2 is assumed in these descriptions and discussions.

## 2. PROCEDURES USED TO ACCOUNT FOR NONUNIFORM FLOW OVER THE FUSELAGE

To account for the nonuniformity of the time-averaged flow over the fuselage, it was necessary to make changes both in the main rotor-wake-flow program and in the supplemental fuselage program. The changes were coded as alternative procedures; so the original structures of the programs were retained. The program changes will be outlined first, and their significance and implementation will then be discussed.

Consider first the revisions to the supplemental fuselage program. The supplemental fuselage program which determines the normalized source strengths was modified to solve for the source strengths  $\sigma_n$ , in a specified nonuniform flow field. The set of equations (Equations (20) of Reference 2)

$$\left. \begin{aligned} \sum_{n=1}^{N_f} B_{mn} \sigma_{x_n} &= -\lambda_{\xi_m} \\ \sum_{n=1}^{N_f} B_{mn} \sigma_{z_n} &= -\nu_{\xi_m} \end{aligned} \right\}; \quad m = 1, 2, \dots, N_f$$

was replaced by the set

$$\sum_{n=1}^{N_f} B_{mn} \sigma_n = - \left[ \lambda_{\xi_m} V_x^{(m)} + \nu_{\xi_m} V_z^{(m)} \right]; \quad m = 1, 2, \dots, N_f \quad (20a)$$

where

$V_x^{(m)}$  &  $V_z^{(m)}$  are known  $x$  and  $z$  components of the time-averaged local velocity at the  $m^{\text{th}}$  element

$\lambda_{\xi_m}$  &  $\nu_{\xi_m}$  are the direction cosines of the normal to the  $m^{\text{th}}$  element with respect to the  $(x, z)$  axes.

$B_{mn}$  are coefficients relating velocities induced by element  $n$  and its image on element  $m$

$N_f$  is the number of fuselage points.

All other relationships of the fuselage program are unchanged.

The main program which computed the position of the wake was modified to account for the contribution of a fuselage in a steady nonuniform flow as follows. The equations (Equations (13) of Reference 2)

$$\begin{aligned} V_{x_f}(x, y, z) &= \sum_{m=1}^{N_f} [\sigma_{x_m} V_{x_\infty} + \sigma_{z_m} V_{z_\infty}] [V_{x_m} + \tilde{V}_{x_m}] \\ V_{y_f}(x, y, z) &= \sum_{m=1}^{N_f} [\sigma_{x_m} V_{x_\infty} + \sigma_{z_m} V_{z_\infty}] [V_{y_m} - \tilde{V}_{y_m}] \\ V_{z_f}(x, y, z) &= \sum_{m=1}^{N_f} [\sigma_{x_m} V_{x_\infty} + \sigma_{z_m} V_{z_\infty}] [V_{z_m} + \tilde{V}_{z_m}], \end{aligned} \quad (13)$$

which define  $x$ ,  $y$ ,  $z$  components of the velocity induced by the fuselage at a point  $(x, y, z)$ , were replaced by the equations

$$\left. \begin{aligned} V_{x_f}(x, y, z) &= \sum_{m=1}^{N_f} \sigma_m (V_{x_m} + \tilde{V}_{x_m}) \\ V_{y_f}(x, y, z) &= \sum_{m=1}^{N_f} \sigma_m (V_{y_m} - \tilde{V}_{y_m}) \\ V_{z_f}(x, y, z) &= \sum_{m=1}^{N_f} \sigma_m (V_{z_m} - \tilde{V}_{z_m}) \end{aligned} \right\} \quad (13a)$$

where

$V_{x_\infty}$  &  $V_{z_\infty}$  are the time and spacial averaged velocities in the  $x$  and  $z$  directions.

$V_{x_m}$ ,  $V_{y_m}$ ,  $V_{z_m}$  are the  $(x, y, z)$  components of velocity induced at a point by a source of unit strength at the  $m^{th}$  element (the tilde ( $\sim$ ) indicates the velocity induced by the image of the element).

That is, the quantity  $[\sigma_{x_m} V_{x_\infty} + \sigma_{z_m} V_{z_\infty}]$  is simply replaced by  $\sigma_m$  as computed by solving Equations (20a).

The modified programs are utilized in the following manner. First a flight condition is chosen, by specifying  $\mu$ ,  $\lambda$ ,  $\alpha_T$ , etc. Then, the main program is run with the fuselage representation omitted, until periodicity is established in the wake flow. The computations are then continued through one

period (i. e. through  $N_A/N_B$  azimuth positions), computing the flow at the points

$$(\bar{x}_m, \bar{y}_m, \bar{z}_m), (\bar{x}_m, -\bar{y}_m, \bar{z}_m), \quad m = 1, 2, \dots, N_f.$$

It will be recalled that these are the points and their images with respect to the fuselage plane of symmetry at which the fuselage boundary condition is satisfied. Nonuniformity in the flow is taken into account by computing a time average of the flow at each of these points, and then requiring the fuselage source strengths to be such as to just cancel the component of this average flow which is normal to the element. Specifically, the quantities  $V_x^{(m)}$  and  $V_z^{(m)}$  of Equations (20a) are computed according to

$$V_x^{(m)} = \frac{N_B}{2N_A} \left\{ \sum_{k=1}^{N_A/N_B} \left[ V_x(\bar{x}_m, \bar{y}_m, \bar{z}_m; \psi_k) + V_x(\bar{x}_m, -\bar{y}_m, \bar{z}_m; \psi_k) \right] \right\}$$

$$V_z^{(m)} = \frac{N_B}{2N_A} \left\{ \sum_{k=1}^{N_A/N_B} \left[ V_z(\bar{x}_m, \bar{y}_m, \bar{z}_m; \psi_k) + V_z(\bar{x}_m, -\bar{y}_m, \bar{z}_m; \psi_k) \right] \right\}$$

where  $V_x$  and  $V_z$  are components of fluid velocity in the  $x$  and  $z$  directions, respectively, as defined by Equations (3) of Reference 2, and  $\psi_k$  denotes the  $k^{th}$  rotor azimuth position. Note that the flow at the image point has been averaged into  $V_x^{(m)}$  and  $V_z^{(m)}$  to account in part for any asymmetry in the flow with respect to the  $x$ - $z$  plane.

The values of  $V_x^{(m)}$  and  $V_z^{(m)}$  as so computed are supplied as inputs to the fuselage program and utilized in Equation (20a). The right-hand side of that equation may be identified as the negative of the component of the time-averaged velocity at  $(\bar{x}_m, \bar{y}_m, \bar{z}_m)$  which is normal to element  $m$ . The

source strengths  $\sigma_m$  are computed by solving Equations (20a) and are then made available to the main program where they are used in Equations (13a) when computing the flow at a given point.

### 3. RESULTS OF COMPUTATIONS WHICH ACCOUNT FOR NONUNIFORM FLOW OVER THE FUSELAGE

#### GENERAL REMARKS

It was reasoned in Reference 1 that the assumption of uniform flow employed to determine the strengths of the source sheets representing the fuselage was most questionable in the region close to the fuselage when the rotor was in the flight range  $0.05 \leq \mu \leq 0.10$ . In this flight range, wake vortices are swept directly over the region which is occupied by the fuselage. Thus spacial variations in the velocity occur which are much larger than those experienced at higher or lower advance ratios. Since the fuselage influence is substantial in this range of advance ratios, these large spacial variations should be important in determining the contribution of the fuselage to the net flow. To determine the soundness of this reasoning, the analysis of two flight configurations reported in Reference 1, which had been based on a constant and uniform flow over the fuselage, were repeated taking account of the nonuniform flow over the fuselage. The results of the computations are discussed below. To facilitate comparisons between the two fuselage models, the results are presented for the same spacial locations as in Reference 1.

#### THE FLOW AT A HIGH ADVANCE RATIO

The flight configuration at an advance ratio of 0.220 was selected as typical of the high advance ratio flows. This case was computed using a nonuniform flow to determine the fuselage source strengths. Presented in Figures 1 through 4 are plots of the spacial distributions of the velocity components at various rotor azimuths. Comparisons are shown between the velocities computed using the uniform and nonuniform fuselage flow models.

As expected, no appreciable difference was obtained in the velocities computed at distances greater than  $0.2R$  from the fuselage. The largest deviations were obtained in the  $V_x$  and  $V_z$  components in the immediate

vicinity of the fuselage (see Figure 1). The computed value of the  $V_z$  component using the nonuniform flow model was found to be reduced by approximately 10%, while the  $V_x$  component was increased by approximately 10%.

The spacial variations in the velocities are still primarily attributable to the fuselage and the azimuthal variations remained nearly constant.

#### THE FLOW AT A LOW ADVANCE RATIO

Of the cases investigated in Reference 1, the flow at  $\mu = 0.0732$  was found to exhibit a relatively large dependence upon the fuselage (see Figure 46 of Reference 1). It was also found that the spacial variation of the downwash in the volume occupied by the fuselage (computed with the fuselage removed from the flow) was large (see Figure 55 of Reference 1). Hence, this case was selected to be recomputed using the nonuniform flow model to determine the source strengths representing the fuselage. The results of the computations are presented in Figures 5 through 10 along with the corresponding results for the uniform flow model.

It was found that all of the velocity components were altered. The magnitudes of the differences and whether the variation was an increase or a decrease depended upon the distances from the fuselage and the rotor plane. The velocities computed using the nonuniform flow model differed from the velocities computed using the uniform flow model by 8% to 14% in the region  $0.1R$  to  $0.2R$  from the fuselage.

The general character of the flow was found, however, to be the same for both models.

Figure 10 COMPARISON OF THE VARIATION OF VELOCITY COMPONENTS WITH  $x$  FOR  $y = 0$ ,  $z = -0.15$  AND  $\mu = 0.0732$

#### 4. CONCLUSIONS AND RECOMMENDATIONS

Based on the comparisons made between the results obtained using a fuselage model for uniform and for nonuniform flow, the following conclusions were drawn.

No differences between the two models were observed in the effects due to the fuselage at distances greater than  $0.2R$  from the fuselage. This was true for both high and low advance ratios.

At the low advance ratio ( $\mu = 0.0732$ ), the nonuniform flow model was found to yield axial velocities which were approximately 14% lower at  $0.1R$  from the fuselage than the uniform flow model. At the high advance ratio ( $\mu = 0.220$ ), the axial velocity was approximately 10% lower at the same locations.

Except for small changes in magnitudes, the character of the flow was the same for both models.

The results of this study show that the effects of the nonuniform flow over the fuselage are significant only in the immediate vicinity of the fuselage (within about  $0.1R$ ). Otherwise, the simpler uniform flow model for the fuselage is recommended in view of the reduction in digital computation time.

## APPENDIX I

### OPERATIONAL INFORMATION FOR THE MODIFIED MAIN PROGRAM

This program is written in FORTRAN IV, with the exception of subroutine CLEAR, which is written in MAP. This routine is used to initialize storages to be zero.

#### INPUTS

CARD 1	NB:	Number of blades, $N_B$
	NRW:	Number of Revolutions of wake per blade, $N_R$
	NA:	Number of azimuth stations, $N_A$
	NPNCH:	Punch option. If zero, no cards are punched at the end of a run. If not zero, all wake point coordinates and core sizes at the final azimuth position are punched on cards.
	NOPT:	If zero, the initial wake configuration is computed. If not zero, initial wake configuration is read in.
	NTAPE:	If not zero, wake point coordinates and velocities are saved on utility Tape 4.
	NPRINT:	If NPRINT = 1, coordinates and velocities for each wake point are printed; if NPRINT = 2, those for every other point are printed; if 3, every third; etc.
	LNCT:	Number of lines desired per page of output.
	NFPT:	Number of fuselage points, $N_F$
	NXPT:	Number of points off the wake for which velocities are to be calculated.
	NPINT:	Output is produced at intervals of NPINT steps; i. e., if NPINT = 1, the data for each azimuth position is printed.

CARD 2	NFOPT:	Fuselage Option	$\left\{ \begin{array}{l} = 0; \text{ indicates} \\ \quad V_{x_{\infty}} = 1, V_{y_{\infty}} = 0 \\ \neq 0; \text{ indicates uniform} \\ \quad \text{flow option.} \end{array} \right.$
	NOUPT:	Output Option	

CARD 3	PSI0:	Initial position of blade 1, $\psi_{init}$ , degrees.
	REV:	Number of revolutions of rotor for which calculations are to be performed, $N_{RV}$
	XLAM:	$\lambda$
	XMU:	$\mu$
	ALPHAT:	$\alpha_r$ (degrees)
	FACTR:	Factor applied to $V_{y_{\infty}}$ , $K_f$
	RB:	$R/b$

CARD 4, 5,	GAMB:	Strengths of blade 1; NA of them.
	A1:	Core sizes at Blade 1; (NA of them).
	A:	Initial core sizes; (NRW)(NA)(NB) of them.

Fuselage Data: Four cards for each point; (4)(NFPT) cards in all.  
 These are punched by the Fuselage Program.

Card 1	XBAR $\bar{x}$	YBAR $\bar{y}$	ZBAR $\bar{z}$	SIGX $\sigma_x$	SIGZ $\sigma_z$	
Card 2	XI1 $\xi_1$	XI2 $\xi_2$	XI3 $\xi_3$	XI4 $\xi_4$	ETA1 $\eta_1$	ETA2 $\eta_2$

Card 3	ETA3	ETA4	D1	D2	D3	D4
	$\eta_3$	$\eta_4$	$d_1$	$d_2$	$d_3$	$d_4$

Card 4	XLE	XME	XNE	XLZ	XMZ	XNZ
	$\lambda_7$	$\mu_7$	$\nu_7$	$\lambda_5$	$\mu_5$	$\nu_5$

Coordinates of points off the wake at which velocities are to be computed  
NXPT points in all (up to three sets of coordinates per card):

XIPT	YIPT	ZIPT
$x$	$y$	$z$

Initial Wake Configuration - Read in only if NOPT is not zero.

X: (NRW)(NB)(NA) of them.

Y: (NRW)(NB)(NA) of them.

Z: (NRW)(NB)(NA) of them.

A listing of the program is given on the pages which follow.

## APPENDIX II

## OPERATIONAL INFORMATION FOR THE MODIFIED SUPPLEMENTAL FUSELAGE PROGRAM

**This program is written completely in FORTRAN IV.**

## INPUTS

CARD 1	NPTS:	Number of fuselage elements $N_p$
	NPRNT:	Number of $\beta_{ij}$ coefficients to be printed; i. e. NPRNT = (NPTS) (NPTS).
	NIT:	Maximum number of iterations to be allowed in solving the equations ( in case of divergence of the iterations).
	NOPT:	$\begin{cases} \neq 0; \text{ indicates nonuniform flow option.} \\ = 0; \text{ indicates uniform flow option.} \end{cases}$
	NDVCH:	Not used.

CARD 2, 3, ..., (2)(NPTS) + 1     $x_{11}, y_{11}, z_{11} ; x_{21}, y_{21}, z_{21}$ .  
     $x_{31}, y_{31}, z_{31} ; x_{41}, y_{41}, z_{41}$ .  
     $x_{12}, y_{12}, z_{12} ; x_{22}, y_{22}, z_{22}$ . etc.

A listing of the program is given on the pages which follow.

<b>13. ABSTRACT</b> <p>This addendum reports the results of an extension to the study to determine the time varying flow in the vicinity of a helicopter rotor in hovering and forward flight and having a fuselage immersed in the rotor wake. The purpose of this extension was to compare two models representing the fuselage. The first fuselage model, reported in Parts 1 and 2, was based upon the assumption that the fuselage was immersed in a constant and uniform flow; the second model was based upon the assumption that the fuselage was immersed in a constant but non-uniform flow.</p> <p>Comparisons between the two models are presented. Program listings and operational information related to the programs are given in the appendices.</p>

INSTRUCTIONS

1. **ORIGINATING ACTIVITY:** Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (*corporate author*) issuing the report.

2a. **REPORT SECURITY CLASSIFICATION:** Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.

2b. **GROUP:** Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.

3. **REPORT TITLE:** Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.

4. **DESCRIPTIVE NOTES:** If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.

5. **AUTHOR(S):** Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.

6. **REPORT DATE:** Enter the date of the report as day, month, year, or month, year. If more than one date appears on the report, use date of publication.

7a. **TOTAL NUMBER OF PAGES:** The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.

7b. **NUMBER OF REFERENCES:** Enter the total number of references cited in the report.

8a. **CONTRACT OR GRANT NUMBER:** If appropriate, enter the applicable number of the contract or grant under which the report was written.

8b, 8c, & 8d. **PROJECT NUMBER:** Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.

9a. **ORIGINATOR'S REPORT NUMBER(S):** Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.

9b. **OTHER REPORT NUMBER(S):** If the report has been assigned any other report numbers (*either by the originator or by the sponsor*), also enter this number(s).

10. **AVAILABILITY/LIMITATION NOTICES:** Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as:

- (1) "Qualified requesters may obtain copies of this report from DDC."
- (2) "Foreign announcement and dissemination of this report by DDC is not authorized."
- (3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through \_\_\_\_\_."
- (4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through \_\_\_\_\_."
- (5) "All distribution of this report is controlled. Qualified DDC users shall request through \_\_\_\_\_."

If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.

11. **SUPPLEMENTARY NOTES:** Use for additional explanatory notes.

12. **SPONSORING MILITARY ACTIVITY:** Enter the name of the departmental project office or laboratory sponsoring (*paying for*) the research and development. Include address.

13. **ABSTRACT:** Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.

It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).

There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.

14. **KEY WORDS:** Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.
